

Security incident report

Section 1: Identify the network protocol involved in the incident

The network protocol involved in this incident is **HTTP**, which uses the **TCP transport protocol on port 80**. Before the HTTP request is sent, TCP establishes the connection using the **three-way handshake: SYN, SYN-ACK, and ACK**.

Section 2: Document the incident

The logs show that the client performs a DNS lookup, establishes a TCP connection, and sends an HTTP GET request to the web server. After the connection is established, a large amount of HTTP traffic follows, which could indicate repeated requests consistent with a brute force attack.

Section 3: Recommend one remediation for brute force attacks

The administrator should enforce strong password policies and enable account lockout after several failed login attempts. This helps prevent brute force attacks.
